## **iMPath's Transporter Series now Replaced by i-Volution Series**

After 12 successful years of sales, our Transporter series of Broadband analog products will be officially replaced by our i-Volution series of digital codecs. The market demand and acceptance for digital products has been overwhelming. When we introduced our first i-Volution encoders and decoders in 2001, analog systems still had a price advantage over digital systems. Within 4 years, the CCTV industry has defined standards for interoperability based on MPEG technology and our customers have benefited with increased functionality and lower prices.

Over 90% of our system sales have now migrated to the superior digital platform of iMPath's i-Volution series. We will now discontinue sales of the Transporter analog systems, with our commitment to continue supporting the products as long as we can source the components. We still have stock on several of the option cards, but we will no longer manufacture effective June 1<sup>st</sup> of 2006. Now is a good time to consider ordering spares for your Transporter equipment.

Another contributing factor in our decision to discontinue the product line is the ROHS "Restriction of the use of certain Hazardous Substances" directive or more commonly called "lead-free" process which will come into effect in July of 2006. As such, the entire Transporter series would require a new design. All of our i-Volution products will meet this new "ROHS" directive.

Please contact your local iMPath representative to discuss spares for your Transporter systems. Also check out our web site for exciting news and developments in our i-Volution series. <http://www.impathnetworks.com>
